

Geometry of singular surfaces and curves

Kentaro Saji

Department of Mathematics, Graduate School of Science
Kobe University, Japan

In this course, introduction and recent developments of geometry of singular surfaces and curves will be described. Roughly speaking, to study such kind of geometry, there are three approaches. While mentioning each of these approaches, the classical differential geometric approach will be taken. Firstly we give criteria for fundamental singularities and using it, the computation of differential geometric invariants of several wave front surfaces will be given.
